l'Exploration de la Mer

MSFD descriptors

- (1) **Biological diversity** is maintained. The quality and occurrence of habitats and the distribution and abundance of species are in line with prevailing physiographic, geographic and climatic conditions.
- (2) **Non-indigenous species** introduced by human activities are at levels that do not adversely alter the ecosystems.
- (3) Populations of all **commercially exploited fish and shellfish** are within safe biological limits, exhibiting a population age and size distribution that is indicative of a healthy stock.
- (4) All elements of the marine **food webs**, to the extent that they are known, occur at normal abundance and diversity and levels capable of ensuring the long-term abundance of the species and the retention of their full reproductive Capacity.
- (5) Human-induced **eutrophication** is minimised, especially adverse effects thereof, such as losses in biodiversity, ecosystem degradation, harmful algae blooms and oxygen deficiency in bottom waters.
- (6) **Sea-floor integrity** is at a level that ensures that the structure and functions of the ecosystems are safeguarded and benthic ecosystems, in particular, are not adversely affected.
- (7) Permanent alteration of **hydrographical conditions** does not adversely affect marine ecosystems.
- (8) Concentrations of **contaminants** are at levels not giving rise to pollution effects.
- (9) **Contaminants in fish and other seafood for human consumption** do not exceed levels established by Community legislation or other relevant standards.
- (10) Properties and quantities of **marine litter** do not cause harm to the coastal and marine environment.
- (11) Introduction of **energy, including underwater noise**, is at levels that do not adversely affect the marine environment.

So many words.....

Descriptor: MSFD descriptor of GES (for instance biological diversity is maintained)

Attribute: The combined attributes describe all qualities of Descriptor (for instance states of species, habitat, ecosystem)

Criteria: to assess an attribute 'distinctive technical features that are closely linked to qualitative descriptors'

Indicators: measurement of criteria

Target: the desired minimum condition to fulfill GES

Targets have been identified in a few cases where they are defined in other legislation (fishing mortality, contaminants in seafood) – otherwise to be identified in process

Do the criteria and methodologies proposed give sufficient guidance for target identification?

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

Information basis

The collection of marine data is expensive – use indicators which can be based on existing data collection programmes

Different indicators require different scales of space and time (biodiversity, food web versus seafloor integrity and eutrophication)

It may be difficult to find indicators which are directly linked to a descriptor and to management measures

Insufficient knowledge about marine ecosystems – Marine research strategy

Adapt

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

1. Biodiversity

Biological diversity is maintained. The quality and occurrence of habitats and the distribution and abundance of species are in line with prevailing physiographic, geographic and climatic conditions.

Good Environmental Status for Descriptor 1 will be achieved given no further loss of the diversity of genes, species and habitats at ecologically relevant scales and when deteriorated attributes, where intrinsic environmental conditions allow, are restored to target levels.

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

1. Biodiversity

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Species state	Species distribution Population size Population condition	Range Pattern Abundance and/or biomass Demographic characteristics Genetic structure
Habitat state	Distribution Extent Condition	Range Pattern Area (volume) Condition of typical species Relative abundance/biomass Physical, hydrological, chemical composition
Ecosystem state	Ecosystem structure	Condition and relative proportion of habitats and species

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

2. Non-indigenous species

Non-indigenous species introduced by human activities are at levels that do not adversely alter the ecosystems.

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Prevalence	Abundance and state of non-indigenous species (esp invasive species)	Trends in abundance, temporal occurrence, spatial distribution
Impacts	Environmental impact of invasive species	Ratio between invasive species and native species Impacts of invasive species + species, habitats, ecosystems

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

3. Commercially exploited fish and shellfish populations

Populations of all **commercially exploited fish and shellfish** are within safe biological limits, exhibiting a population age and size distribution that is indicative of a healthy stock.

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Sustainability of exploitation	Exploitation sustainable consistent with high long-term yield	Fishing mortality (F equal to or lower than FMSY) If F not available: ratio catch/biomass
Reproductive capacity	Reproductive capacity should not be compromised	Spawning stock biomass or biomass indices
Age and stock composition	Enough older/larger fish to ensure stock resilience	Proportion of fish larger than size of first maturity Mean maximum length across all species found in research vessel surveys 95% percentile of fish length distribution observed in research vessel surveys Secondary: size at first sexual maturity

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

Is MSY a step forward?

Present situation: Fishing mortality 2-3 times FMSY for many stocks

This means that there are excessively high pressures on marine ecosystems – habitat impacts, bycatches etc

Member States have subscribed to a MSY by 2015 target

Reducing Fishing mortality is IN THE PRESENT SITUATION the most significant step one can take to reduce ecosystem impacts (bycatches, habitat impact, ecosystem integrity impact)

In parallel to that efforts must be made to reduce bycatches and habitat impacts

MSY by 2015 is a first step only which in itself does not address all aspects of an ecosystem approach – beyond 2015 further steps are required

MSY is a necessary but not sufficient element in an ecosystem approach

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

4. Food webs

All elements of the marine **food webs**, to the extent that they are known, occur at normal abundance and diversity and levels capable of ensuring the long-term abundance of the species and the retention of their full reproductive Capacity.

Good Environmental Status of Food Webs will be achieved when the indicators describing the various attributes of the descriptor reach the thresholds set for them. These should ensure that populations of selected food web components occur at levels that are within acceptable ranges that will secure their long-term viability.

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

4. Food webs

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Energy flow in food webs	Productivity of key species or groups	Performance of key predator species (production/biomass)
Structure of food webs	Proportion of selected species at the top of food webs Abundance of key groups/species	Proportion of large fish Abundance of functionally important groups/species -Early warning indicators/fast turnover -Affected by human activities -Habitat defining -Top of food web -Migratory -Species tightly linked to species at other trophic level

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

5. Eutrophication

Human-induced **eutrophication** is minimised, especially adverse effects thereof, such as losses in biodiversity, ecosystem degradation, harmful algae blooms and oxygen deficiency in bottom waters. – linked to Water Framework Directive

GES with regard to eutrophication has been achieved when the biological community remains well-balanced and retains all necessary functions in the absence of undesirable disturbance associated with eutrophication (e.g. excessive algal blooms, low dissolved oxygen, declines in seagrasses, kills of benthic organisms and/or fish) and/or where there are no nutrient-related impacts on sustainable use of ecosystem goods and services.

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

5. Eutrophication

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Nutrient levels	Increase Deviation from normal proportions	Nutrient concentration in water column Nutrient ratios (Si, N, P)
Direct effects		Chlorophyll concentrations Water transparency related to suspended algae Abundance of opportunistic macroalgae (detrimental effects, blankets) Species shift in floristic composition
Indirect effects	Adverse impacts on perennial flora Decrease in O ₂ due to increased organic decomposition	Abundance of perennial seaweeds and seagrasses Dissolved oxygen

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

6. Sea floor integrity

Sea-floor integrity is at a level that ensures that the structure and functions of the ecosystems are safeguarded and benthic ecosystems, in particular, are not adversely affected.

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Physical damage having regard to substrate characteristics	Biogenic substate impact Overall impact	Type, abundance and areal extent of biogenic substrate Extent of seabed affected by human activities for different substrate types
Condition of benthic community		Presence of particularly sensitive or tolerant species Indexes assessing benthic community function and functionality (diversity, richness, proportion of opportunistic or sensitive species)

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

7. Hydrographical conditions

Permanent alteration of **hydrographical conditions** does not adversely affect marine ecosystems.

Linked to specific installations etc.

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Spatial characterisation of permanent alterations	Case-by-case basis	Extent of area affected by the alteration
Impact of permanent hydrographical changes	Case-by-case basis	Spatial extent of affected habitats Changes in habitats, in particular functions provided (spawning, breeding, feeding areas etc)

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

8. Contaminants and pollution effects

Concentrations of **contaminants** are at levels not giving rise to pollution effects.

- Linked to Water Framework Directive

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Concentration of contaminants	'Presence ... kept within acceptable limits'	Concentration in relevant biota/sediment/water
Effects of contaminants	'effects are kept within acceptable limits'	Levels of pollution effects on ecosystem components concerned Occurrence, origin and extent of acute pollution events (such as oil slicks) and their impacts on biota physically affected

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

9. Contaminants in fish and other sea food

Contaminants in fish and other seafood for human consumption do not exceed levels established by Community legislation or other relevant standards.

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Level, number and frequency of contaminants	Regulatory levels not exceeded	Actual level of contaminants that have been detected Number of contaminants having exceeded maximum regulatory level Frequency of regulatory levels being exceeded

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

10. Litter

Properties and quantities of **marine litter** do not cause harm to the coastal and marine environment.

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Characteristics of litter in the marine and coastal environment		Trends in litter washed ashore - composition, spatial distribution, source Trends in litter floating at surface Trends in micro-particles
Impacts of litter on marine life		Trends in amount and composition of litter ingested by marine mammals

ICES

International Council for
the Exploration of the Sea

CIEM

Conseil International pour
l'Exploration de la Mer

11 Energy and noise

Introduction of energy, including underwater noise, is at levels that do not adversely affect the marine environment.

ATTRIBUTE	Criteria to assess the descriptor	Indicators to be measured
Distribution in time and place of loud, low and mid+frequency impulsive sounds		Proportion of days and distribution over year and in space exceeding high levels (sound exposure level or peak level) 10 Hz to 10 kHz
Continuous low frequency sound		Trends in continuous ambient noise level around 63 and 125 Hz

Ecosystem impact indicators in DCF

Indicators of fisheries impacts on marine ecosystems:

- Conservation status of fish species
- Proportion of large fish
- Mean maximum length of fishes
- Size at maturation of exploited fish species
- Distribution of fishing activities
- Aggregation of fishing activities
- Areas not impacted by mobile gears
- Discarding rates of commercially exploited species
- Fuel efficiency of fish capture
